

SEVERAL GOOD REASONS TO CHOOSE A BIGWHEEL TRAILER

1 A FRAME THAT ASSURES SECURITY AND PROTECTION

100% welded and hot dipped galvanised to 70 microns thick, (compared to 7 microns thick for pre-galvanised sheets.) No rivets or bolts to cause vibration or wear by rubbing.

*Pregalvanised: 0,32 oz of zinc per square foot
Hot dipped galvanise: 1,50 oz per square foot
Source: ASTM International*

2 STRONG RESISTANT PLATFORM STRUCTURES

Made of structural angle iron which has a greater resistance to heavy loads than bent steel sheet metal platforms.

3 HIGHER QUALITY LIGHTING THAT LASTS LONGER

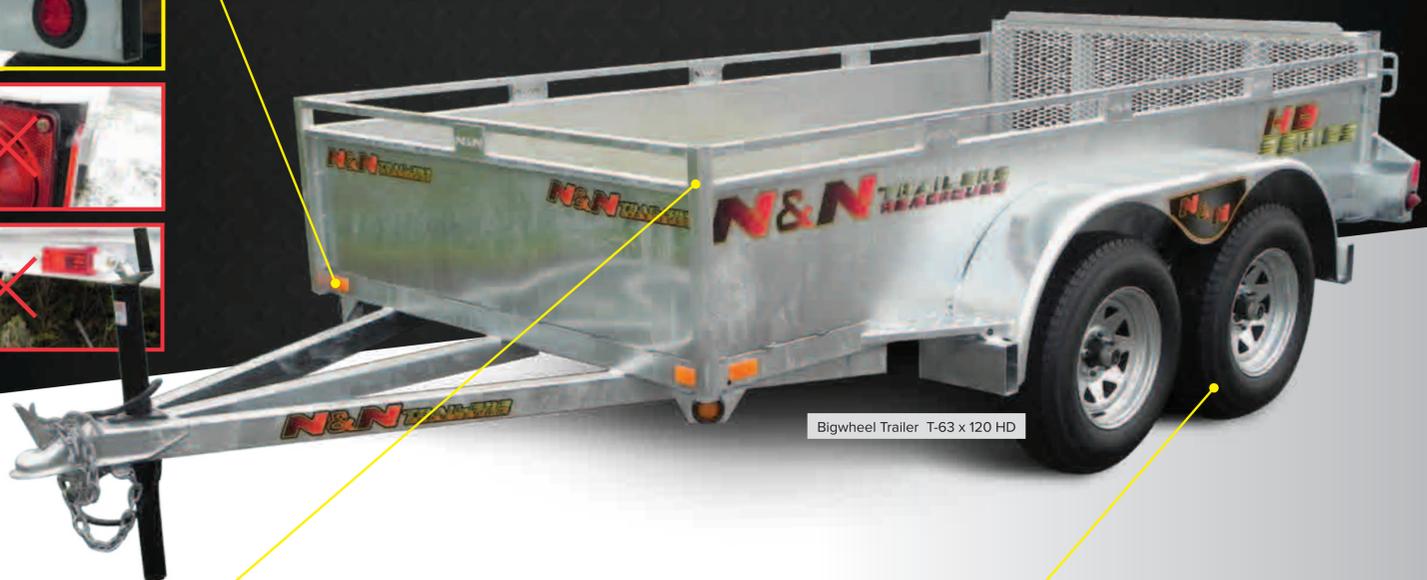

100% led lights assure better visibility and are less energy-consuming than incandescent lights.

4 SUPERIOR ANCHORING SYSTEM

Four anchor rings are bolted solidly through the floor to the frame of the trailer, making them stronger than recessed models screwed or bolted to the floor only.

5 EASILY EXPANDABLE SIDE PANELS

Open corner posts make an easy job of adding additional panels to increase the height of the sides of the trailer.

6 DURABLE TIRES THAT HOLD THE ROAD

Steel belted radial tires are installed on all of our standard models. More secure, longer lasting, and less problematic than conventional tires.

7 A DURABLE SUSPENSION WITH EASY MAINTENANCE

Slipper spring suspensions on our tandem models require less maintenance. Certain N & N models can be greased.

8 WIRING PROTECTED FROM BAD WEATHER CONDITIONS

Installed inside of the tubes of the frame, the wiring is protected from elements like rocks and abrasives that could eventually damage it.

9 BETTER QUALITY WIRE CONNECTIONS

Wiring is welded by "ultrasound" and connections are sealed by heat-shrinkable tubing to make sure they are weather tight. Much better contact than compressed connectors. "No screwed grounds at N & N" !
